

DigiBS-IG

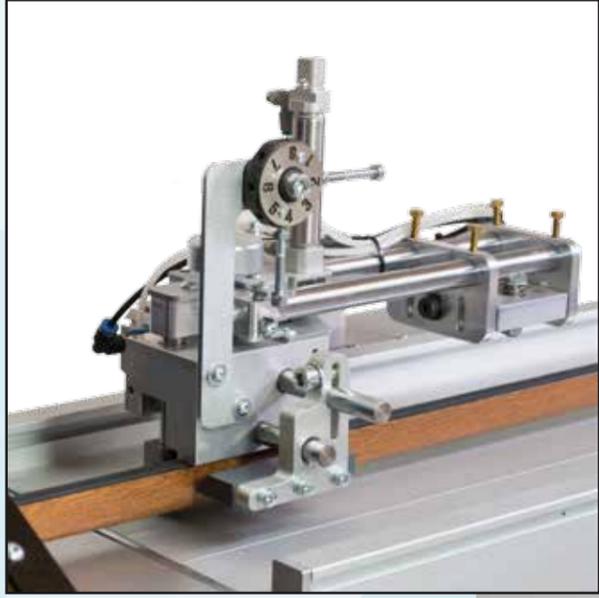

-- INTEGRATED SAW SYSTEM --

The DigiBS-IG is the evolution of the DigiBS concept designed to improve productivity and accuracy. The Cutting Unit is equipped with the same 'Up-cut' type of saw with a blade diameter of 250 mm on a rotary table controlled by the CNC unit which allows to achieve angles from 20° to 160° with the astonishing accuracy of ± 0.1 degrees.

The revolution comes with the Length Stop Unit, moved on the infeed side of the Cutting Unit and equipped with the brand new Infeed Gripper taking the place of the stop. It slides on the 3 meters table made of robust aluminium structural profiles and it's positioned by a stepper motor integrated in the carriage with a magnetic encoder feedback to achieve the required precision of ± 0.1 mm on all the stroke.

The design of the Infeed Gripper is based on the experience made with the quick adjusting, blockless device of the DigiBS, so there is no need of specific equipment for each profile, you just need to change the preset of the glass simulator every time you need to work a different profile. The glass simulator is controlled by the CNC that lifts it while moving to reduce friction and facilitate the loading of a new bar.

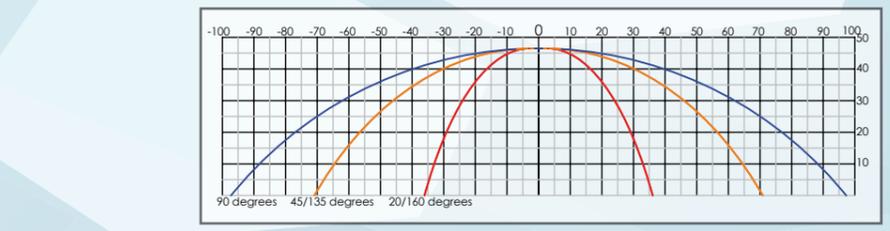

The software has been designed to be the most self-sufficient, from the moment of the load of the bar and the first cut to the end of the material, detected by a sensor mounted on the clamp. In this way the cutting process of the bead is completely managed by the CNC unit from the first cut, positioning, clamping and cutting. The operator just needs to press start to perform each entry and unload the worked piece, with obvious advantages in speed and precision, leaving out of the process any operator-dependant mistake like misplacing of the bead or deforming the processed end of the bar against the measurement stop. All the informations about the cutting cycle are taken directly from the list, so the machine can know if it's necessary to perform an intermediate headcut in case of different cutting cycles.

INTEGRATION
This evolution of the DigiBS elights even more the main advantages of a single machine that manages both the positioning and the cutting process:

- One control unit means contemporaneity in operations, improving speed, precision and quality of the process.
- One interface to operate the machine, few commands and setup made on just one screen.
- No need for interconnection between two units, the Control Unit knows both the positions of the blade and the clamp, that are parts of the same machine.

CONNECTIVITY
The new control unit of DigiBS integrates an USB port, Ethernet port and a radio interface used for the reception of measurements from Digi-FAMILY'S devices. It offers multiple solutions to compile / get the list of measurements to be cut as:

DigiBS-IG is configurable any time LH to RH or RH to LH

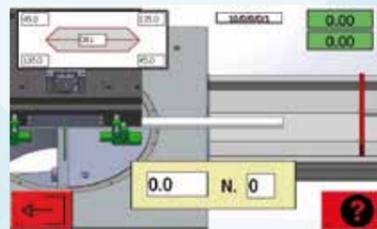

Images and data are indicative

Cutting Unit	
Kind of cut	Up-cut saw
Cutting angles	CNC-controlled "arrow cut" 20 to 160 degrees
Blade	Ø 250 mm
Blade motor	Three phase 0.75 kW 2800 rpm
Positioning Unit (Clamp)	
Stroke	3000 mm
Carriage movement	Stepper motor, magnetic encoder feedback
Accuracy	± 0.1mm
Positioning speed	Up to 50 m/min
Electronic	
Control Unit	HMI 7" colour touch screen PLC Cards
Radio Interface	Integrated
USB for external input devices/pendrive	Integrated

User friendly interface, big function buttons on screen and physical push buttons for the most useful actions

Semi automatic mode for single cut

Cutting cycles database (combinations of angles)
Cycles can be associated with DigiBAR references and automatically performed during automatic cycles
